

BackupManager

The flexible data backup software for your HOMAG machine.

Loss of data due to malware or a defective hard drive can wipe out valuable know-how and lead to massive disruptions in your company's production. With BackupManager, you can protect your company against data loss and easily restore the original state of your machine in the event of a hardware defect. The additional function "backup to network drives" allows you to store 1:1 backups of the machine data centrally on your network. The backup of the machine data can therefore be integrated into the overall concept of your company backup solution. Manual backups are no longer necessary because the data backup is fully automated. Another advantage is that there is no need to install additional software on your machine.

Your benefits at a glance:

- ✔ **Saves time:** The fully automated data backup eliminates manual work steps.
- ✔ **Always up to date:** Simple and individual planning of cyclical data backups.
- ✔ **Safety in the event of hardware defects:** In the event of a defective machine computer, the previous software version can be restored using the machine image and a bootable HOMAG storage medium.
- ✔ **Security in the event of virus attacks and malware:** By creating data backups periodically, a machine image with an undamaged software version can be accessed in the event of a malware attack.
- ✔ **Easy to use:** No additional software is required.
- ✔ **Transparent tracking:** The dates of the machine images enable a clear and comprehensible backup history.
- ✔ **Fast processing:** If required, the function can be enabled via HOMAG function+ (for selected series from 05/2023).

More information on **function+** can be found at docs.homag.cloud
